In this issue of Challenge, we've made guite a few changes in the design of the magazine. We think this improves the magazine's overall appearance,

makes it easier to read, and generally gives you a better looking product. Write and let us know what you think.

We are introducing a new feature for the **Twilight: 2000** section with this issue. It will be called **Equipment List**, and it will feature vehicles, weapons, and other items of interest to Twilight players.

Among other changes we will be making, I will finally be getting some help with the editorial chores, beginning next issue. Tim Brown, of the GDW staff, will be coming on board as Associate Editor, assuming many of the editorial duties connected with the JTAS section. Tim has been involved in the design and development of both Traveller and Twilight modules, and brings a great deal of knowledge and expertise with him. I will become Managing Editor, and will exercise overall control. -I oren K. Wiseman

BETWEEN WORLDS

Issue 4 has just arrived, containing articles on Bounty Hunters as a character class and a short freelance adventure.

Subscriptions are \$7.00 per year (12 issues).

Publisher: MAFS Production, LTD.

Between Worlds, 3914 Angeles, Tampa, FL 33629.

TRAVELLERS DIGEST

Issue Number 5 is now available, containing "The Humaniti Experiment," more Vland sector data, and articles by Marc Miller and J. Andrew Keith.

REGINA/REGINA (0310 A788899 A)

Date: 102 1112

¶ A dispatch from Terra/Sol (0207 A867A69 F) dated 121-1111 reads: "The first known victim to survive direct exposure to hyperspace arrived at Terra today, suffering from what medical experts are calling 'Hyperspace sickness'. Naval commander Ansel Churner, an engineering officer on his way to retirement on Prometheus, is being held in strict guarantine until specialists can determine the specific effects the exposure will have. Doctors working on the case are quoted as saying that preliminary tests indicate that Cdr. Churner is in good condition, but is not mobile".

1 "Three members of the engineering department on the *Tvrol*, a Rome. Inc. luxury liner were killed. Circumstances of their deaths have not been released at this time".

¶ Admiralty spokesmen at Regina refused to comment on the dispatch.

Traveller News Service is another Imperium wide benefit of membership in the Travellers'Aid Society.

Flow Charts for Manageable Campaigns

The universe is a lace of infinite possibilities. For adventure gaming players (and their characters), this is all for the best, as it frees them to role play subject only to the limits of their imaginations. For the referee, however, the infinite can be a source of nightmarish problems. In Traveller or Twilight:

2000, a dozen or more destinations worlds (whether or village) frequently lie within a few days' travel for a party of adventurers and can be reached in only a few minutes of gaming time. However, no referee (or at least none l've ever met) can properly prepare so many situations. If the players choose to go "off the edge" of the created universe, the game stops while the referee catches up. This is not good. The simplest solution is the "carrot

attractive goal, combined with coercive penalties for any deviation off course.

ability to make really significant choices, without burying the referee in excessive preparation, much of which is destined never to be used.

One solution is flow charting, a common technique in computer programming which allows simple depiction of a whole system including alternative paths and choices. If we read "campaign" for "system," the applications become obvious. Computer flow charting uses specialized symbols: campaign flow charting can be handled with a simple arrangement of boxes and arrows which depict

and stick" approach: an irresistibly

While this method makes a good golf course, it makes a bad adventure game. Sooner or later, the referee's chosen lure will fail to attract the players, and when that happens the difficulty which the players encounter in pursuing their own ends will lead to frustration or boredom. Somehow. the players must be allowed to exercise "free will" and the possible events. In some situations. developments will follow almost inevitably. in a linear fashion:

At other times, player characters will have a variety of legitimate choices, all of which should be made available by the referee (see diagram

2).

Note that the results of different choices can sometimes converge, so that the same NPCs and scenario backdrops can

be employed, even though what happens in each "box" will vary according to the party's previous decisions.

Situations involving major PC choices frequently become convenient stopping points in the game. A referee can offer dozens of alternative paths to his players without excessive work, so long as he or she has to make detailed preparations for only one selected choice between sessions. The results of that choice then become the subject of the next gaming session, concluding with other major decision points.

In practice, an experienced referee can often prepare a linear series of boxes which lack real alternatives, on the basis of the party's known tastes. The PCs will not know which situations involve significant choices from the referee's perspective, and their sense of "free will" will not be reduced just because the referee correctly guesses that they will pursue a given path which he has already prepared. It is also possible to lead the party in a given direction, by offering a variety of choices, which eventually converge:

In this way, some unneeded preparation can be "recycled" for later use: the unselected patron can logically reappear as a rival or rescuer, for example.

The longstanding success of a certain fantasy role playing game is a testimony to the power of flow charting to promote playability. The typical dungeon, with its treasure rooms and diverging corridors, is nothing but a flow chart made concrete. GDW's Annic Nova, with its suspenseful exploration of a derelict starship, takes advantage of the same features. The extension of flow charting to whole campaigns merely involves the recognition of the intangible walls and intersections at work in the world at large.

Steven Sowards

Cargo: A Merchant Prince Variant

Although **Traveller's** new **Merchant Prince** trade system introduces a more sophisticated method for merchant characters to earn profits, it does not include identification of the specific nature of cargoes available for interstellar trade. This article is a look at what might be available on various types of worlds, along with some simple rules and tables to be used to enhance the

Merchant Prince system. These will add color to any campaign.

In addition, this material will help make trade more of an adventure and less of a bookkeeping exercise. It may also affect how characters act in an adverse campaign situation.

As an example, a skipper of a free trader carrying a load of high explosives will be far less likely to stand and fight a suspected pirate than the captain of a freighter carrying steel scrap. Other cargoes, such as a load of live aquatic food animals shipped as zoological specimens, will require special fittings aboard ship, and careful handling and constant monitoring by crew members. Now, with a few extra die rolls, a cargo becomes more than a string of digits recorded in a ship's log; it becomes an active part of the adventure. This is my expansion of the Small Cargo articles which appear occasionally in this magazine.

WORLDS

From the trade and commerce standpoint, there are three basic types of worlds in the **Traveller** universe. These are resource worlds, agricultural worlds, and industrial worlds. The latter two have been discussed extensively in

Traveller rules. The first type includes several previously listed trade classifications in **Merchant Prince**.

Resource Worlds: These are the most numerous, and are most commonly found listed as

"non industrial", that is, lacking extensive heavy industry. They may also be barren worlds, vacuum worlds, fluid ocean worlds, desert worlds, ice capped worlds, or water worlds. They have one thing in common: a medium to low population busily engaged in exploiting the world's natural resources and shipping them to other markets. These worlds are the sources of the universe's metals, radioactives, hydrocarbons, feedstocks, fuel, and (where appropriate) forest products and other organic raw materials. Note that there are nonindustrial worlds which are not exploited for their resources. These can be research station sites, or they may be used for government purposes (imperial or otherwise) or be interdicted for various reasons.

Agricultural Worlds: These worlds are the breadbaskets of the universe. They are rich in organic food, fiber and pharmaceutical products, and have a surplus ready to export to worlds with none or little indigenous natural food production.

Industrial Worlds: The mainstay of any modern interstellar society, these take the raw materials from the resource worlds and convert them into finished goods. This is done with labor intensive methods on moderate tech level worlds, or with technology intensive processes such as automated refineries and factories on higher tech level worlds.

PROCEDURE

To determine what goods are available for purchase on a particular world, roll 2D on one of the cargo tables included with his article before computing the purchase cost. Check the cargo commentary section beneath each table to make sure your ship is prepared to cope with any hazards the available trade goods may bring aboard. If you still wish to purchase the indicated trade goods, then proceed as outlined in **Merchant Prince**.

There are tables included for each of the three major trade types, as well as for several other trade classifications. Be sure to check for die roll modifiers caused by other world characteristics such as tech level or population. In addition, several specialized trade goods tables are included for water worlds, desert worlds, fluid ocean worlds, vacuum worlds and asteroid belts. Either the appropriate specialized table, or a major trade classification table, may be used when determining the available trade goods if the selling world has more than one characteristic: such as water world, agricultural, or fluid ocean, industrial.

Finally, there is a general cargo table designed to be used by skippers calling at worlds that don't fit into any of the above categories, including the rare unclassified planets.

Not all world classifications will generate specific types of cargoes. Their effect on trade and commerce will be more indirect. These include:

Non-agricultural Worlds: Since this classification indicates a lack of a type of trade good, this will only affect the market price paid for the sale of agricultural commodities.

High Population Worlds: Labor costs are lower on these worlds because of their large labor pools. These worlds earn income and trade goods by exporting a high volume of goods. These factors are reflected in the selling price modifiers at high population world starports.

Low Population Worlds: Scarce labor limits production and therefore drives up the cost of exports on these worlds, factors also reflected in the selling price modifiers.

Rich Worlds: Rich worlds enjoy access to abundant resources, have stable societies, and produce high-quality goods. The high-quality of these goods increases demand and results in higher costs to purchasers.

RESOURCE WORLD

2 Processed Radioactives

- 3 Refined Ferrous Metals
- 4 Refined Hydrocarbons
- 5 Refined Non-ferrous Metals
- 6 Refined Ferrous Metals
- 7 Forest Products
- 8 Nitrogen Compounds
- 9 Crystals
- 10 Refined Radioactives
- 11 Refined Precious Metals
- 12 Refined Rare Earths

Poor Worlds: Poor worlds badly need exports to generate income through interstellar trade, and discount costs to shippers to stimulate business.

Of course, a skipper might not want to buy and ship the first available consignment of trade goods. He or she may roll again for others. However, depending on the starport classification, this may take time. Class A starports will have ID consignments available for shipment each week, B starports will have 1D 2 (but at least one each week), C 1 D 4 (but at least one each week), and D starports will have only one

available each week reflecting the level of traffic passing through these facilities. E and X starports will have only one consignment available every 1D weeks, if the first is refused.

Cargoes may be shipped in one of three ways: in bulk, with no maximum or minimum tonnages, in standard cargo containers of 10 tons each, and as single units with specific tonnages, such as a single vehicle. The notes included with each cargo table specify shipment method when necessary.

Resource worlds are generally listed as non-industrial. However, they may be vacuum worlds, asteroid belts, barren worlds, water worlds, and fluid ocean worlds. If a world is listed as both non-industrial, and one of the latter categories, the referee has the option of rolling on the above table, or one of the following specialized tables.

Barren worlds have no separate tables. Cargoes from these planets are rolled on the resource world table. However, they are shipped in bulk and in crude form without processing or refinement.

Processed Radioactives: These include radioactive isotopes including tritium, refined plutonium or other transuranic elements. These are highly radioactive and must be shipped in sealed radiation proof containers. These containers, although designed for safety, may be breached by accident or combat (12 on 2D if a ship carrying radioactives sustains a "hold" hit). If this occurs, crew members exposed to the radiation suffer radiation sickness, taking 1 point of damage per day for the next two weeks for each 10 minutes spent in the cargo hold.

Refined Ferrous Metals: Steel and steel alloys shipped in crude form to another world for further processing and use. This is the most common way resource worlds are exploited. Refineries are established after exploitable ore bodies are discovered, so that usable metals, not rock, is hauled between worlds. Crude ore shipped from barren worlds is most commonly in the form of assay samples shipped for analysis on established worlds to determine if exploitation is economically feasible.

Refined Hydrocarbons: These are polymers and other compounds derived from organic hydrocarbons, as well as coal tars and other petrochemicals that may be further processed on industrial worlds. They may be flammable and/or explosive and are usually poisonous. See the "chemicals" commentary in the industrial worlds section.

Refined Non-Ferrous Metals: Aluminum, titanium, magnesium, mercury, and other non-iron metals shipped in refined form.

Forest Products: Unusual or rare woods, used on other worlds because of their beauty and/or other qualities. These are usually flammable, but not explosive, Roll again if the resource world has an atmosphere less than thin.

Nitrogen Compounds: Unusual or rare organic and/or inorganic compounds prized as fertilizers. Organic compounds may create an odor problem aboard ship. Inorganic compounds such as ammonium nitrate may be explosive.

Crystals: These may be diamonds or similar precious stones. Alternatively, they may be quartz like crystals needed by the electronics or gravitics industry off planet because of their properties or structure.

Refined Radioactives: These are crudely refined uranium, thorium and plutonium. Although less dangerous than processed radioactives, these also must be handled with care.

Refined Precious Metals: Gold, silver, platinum, iridium. Tempting targets to criminally-oriented competition (i.e., hijackers).

Refined Rare Earths: These include molybdenum, yttrium, ytterbium, niobium, and others used in metal alloys; and, of course, the rare and precious lanthanum used in jump coils.

AGRICULTURAL WORLD

- 2 Livestock 3 Fiber
- 4 Meat
- 5 Vegetables
- 6 Grain
- 7 Grain
- 8 Fruit
- 9 Meat
- 10 Herbs
- 11 Processed Food
- 12 Pharmaceutical Feedstocks

Livestock: These will generally be

medium-sized to large herbivore grazers. They may be riding beasts specially bred for racing or food animals. Specific animals should be generated either on the shipping world's specific animal encounter tables or from the appropriate table for the world in Supplement 2, Animal Encounters.

The animal's size will be needed to determine how many of them can be shipped, and to determine if special handling is needed for amphibious or other characteristics. Often, a local

animal handler may need to be hired as a supercargo to tend the livestock until they can be sold off planet. Food (sometimes native plant materials, sometimes synthetics or substitutes) will need to be carried for the animal as well. Most animals will also need water, but this can be taken from the ship's recycling systems without difficulty in most cases. Allow three percent of body weight per day for food. As an example, a 1000 kg animal will require a total of 30 kg per day or 210 kg for a J1 trip. Exceptionally large animals may overload the ship's water system, and necessitate temporary augmentation of it.

Fiber: Animal or vegetable fibers shipped in 50 kilogram bales, usually loaded inside standard cargo containers. These unprocessed textile raw

materials may be flammable, and may cause allergic reactions to crew members if the containers are broached.

Meat: Meat must be stored in a refrigerated cargo hold or container. A power failure aboard ship lasting more than 2D hours, or a long delay in transit, may result in spoilage (which will make the goods unsaleable).

Vegetables: Vegetables are also perishable. They must be delivered quickly to market and shipped in a chilled environment. Most have a narrow temperature range; freezing temperatures will destroy them as readily as warm temperatures will.

Grain: Grain is usually

shipped aboard large bulk carriers, although odd lots are usually available for smaller shippers. All grain is shipped in bulk, and must be hauled in a cargo hold that has been devoted entirely to grain, and that has a protective liner. Grain dust is explosive and can be ignited by static electricity or other sparks (ask any farmer). Cargo hold air should be continually filtered to guard against a potential dust explosion.

Fruit: Fruit must be handled similar to vegetables. Many, however, are more delicate and require more exact temperature controls to avoid damage.

Herbs: These are spices, teas, and mild narcotics to be either drunk as decoctions or smoked. They will usually be shipped in standard cargo containers. Shipments of baled herbs may be encountered and should be considered a fire hazard.

Processed Food (Roll 1D to determine exact type): 1 = A milled grain product such as flour shipped in bulk. 34 = Packaged food, may be frozen or freeze dried. 5 = Wines, usually only high value, rare vintages will be shipped among worlds. 6 = Liquors, which may be a target for pilfering or hijacking.

Pharmaceutical Feedstocks: These are the base material from which drugs are sometimes manufactured, and can range from dried vegetable matter to frozen animal glands. These are high value cargoes prized on the black market, and are often a target of theft or piracy.

Chemicals: These can range from explosives and corrosive acids to ordinary fertilizers. Roll 1D for the exact nature of the trade goods: 1 2 = Explosives, 3 4 = Corrosives, 5 6 = no Special Characteristics. Explosives need

to be kept free of shock or excessive temperatures. Roll 14 + for an explosive cargo to detonate by accident during loading or shipment; DM +2 if temperature at starport is greater than 300C, DM + 6 if ship is hit by laser fire during combat, DM +8 if ship is hit by missile fire. A cargo explosion would destroy the ship and kill the crew. An accidental spill of corrosive chemicals could inflict 3D injury points on a crew member (roll 1 2 on 1D), damage the ship's control or electrical cabling (3 5), or, in an extreme case, breach the hull (6).

Weapons: A consignment may consist of any individual weapon ranging from daggers to fusion guns listed in Basic **Traveller** or Book 4, **Mercenary** as long as it does not exceed the tech level of the shipping world. A weapons shipment may cause trouble with planetary authorities during an attempt to sell the trade goods, depending on the local law level and political situation. it may also be a target for theft and piracy. It could also command a premium price on the black market.

Semi-Finished Metal Products: Metal sheets, beams, piping, or forms to be used either as construction material or finished into a final product such as a ship's hull or ground car body.

Vehicles: Roll 1D: 1 3 = Ground Vehicles, 4 5 = Air Vehicles, 6 = Watercraft. Trade goods may either be the indicated vehicle, or spare

parts for the vehicle (referee's option). The referee must select the specific vehicle type from **Traveller** equipment lists

to determine the tonnage of the shipment.

Clothing: Clothing is generally shipped in closed cargo containers, and is usually considered a low value cargo. However, consignments may consist of valuable haute couture originals, clothing and shoes made of rare leathers or furs.

	L	

Plastics: Plastics products could include plastic feedstock being shipped in bulk, household items made of plastics, including toys, or plastic parts being shipped for assembly into finished goods. They may be flammable (throw 8+ on 2D) or could emit toxic fumes at high temperatures (7+ on 2D).

Electronics: Electronics consignments will most likely consist of small computers, communications gear or entertainment equipment. Sometimes, they may consist of detection equipment. Often, electronics equipment will have military applications.

Mining, Farming, or Construction Equipment: These are heavy, self-

Cybernetics: These are either consignments of powerful "mainframe" computers (roll 1 4 on 1D) or in some cases robotic components (5 6).

Frozen Gases: Rare gases needed for industrial processes and products such as the inert gases xenon, krypton, argon, and neon. These are very dangerous if warmed, and must be shipped in special insulated and pressure tight containers.

DESERT WORLDS WATER WORLDS VACUUM WORLDS & ASTEROID BELTS 2 Water Vapor Condensers 2 Domesticated Marine Animals 2 Small Craft 3 Hydroponic Farming Equipment 3 Small Water Craft 3 Explosives 4 Desert Survival Suits 4 Frozen Gases 4 Live Seafood 5 Computer Chips 5 Artificial Gills 5 Semi-Refined Minerals 6 Stellar Power Systems 6 Vehicles 6 Refined Light Metals 7 Synthetic Food Systems 7 Protein Concentrate 7 Vacc Suits 8 All Terrain Vehicles 8 Organic Chemicals 8 Pressure Tents 9 Resource World 9 Frozen Seafood 9 Mining Lasers 10 Computer Chips 10 Fresh Seafood 10 Vacuum Processed Parts 11 Desert Survival Suits 11 Precious Metals 11 Vacuum Distilled Chemicals 12 Water Vapor Condensers 12 Pharmaceuticals 12 Small Craft

propelled implements such as farm tractors, bulldozers, drilling rigs, or heavy trucks. Most will be wheeled or tracked, although grav trucks may be shipped as well. The minimum mass for this cargo is 10 tons per unit in the consignment.

Consumer Goods: This is a consignment of household appliances and furniture shipped in standard cargo containers.

Machinery: A machinery shipment can range from drill presses and other manufacturing equipment to artificial food synthesizers, and can include engines, production line equipment, and ore processing systems.

Grav Vehicles or Small Craft: These consignments can consist of spacecraft (roll 5 6) up to 100 tons displacement.

Medical Supplies: This may consist of anything from surgical instruments or drugs to a fully equipped mobile field hospital.

Gravitic Components: These are spare anti-gravity modules for grav

vehicles	as	well	as
spare	par	ts	for
gravitic		con	trol
circuits.			

Fusion Power Systems: These are equivalent to starship power plants, but designed for use on worlds as power

FLUID	OCEAN WORLDS	GENER	AL CARGO

6	Petrochemicals	6	Resource

sources for industrial and civil applications. The minimum mass per system is four tons. Newly manufactured systems are shipped "cold" and pose no danger from radiation. However, rebuilt systems from worlds without stringent safety controls may contain residual radiation and could cause radiation sickness to ship's crew and passengers if not properly shielded.

Semi Refined Minerals: Roll on resource world table to determine exact consignment. Reroll if

result is processed radioactives or forest products. **Vehicles:** ATVs (if source is a vacuum world), prospecting buggy ---an air-tight air/raft with navigation and detection gear--- (if source is an asteroid belt).

Domesticated Marine Animals: May be any type of swimming herbivore generated by the referee on the animal encounter tables, or taken from the open sea surface or central depths, encounter tables found in the maritime locations section of Supplement 2, Animal Encounters. Holding tanks, available in 10 ton modules, must

be purchased and installed before the cargo is loaded. Each 10 ton module costs Cr100 new, and from 50 to 90 percent of this price if used. Used containers may leak while in flight, however, killing the contents.

Water Craft: Roll 1D. On 1-2, the consignment is a 500 ton submersible; on 3-4, an eight ton hovercraft, on 5-6, a 60 ton high performance hydrofoil equipped motorboat.

Live Seafood: Marine animals which are carried alive in tanks installed in the cargo hold. They may be any type of swimmer generated on the animal encounter tables mentioned above. Some may have limited air breathing capabilities and locomotion devices such as tentacles or legs which would enable them to escape from an unsecured tank during flight.

Refined Light Metals: These are refined smelted light metals such as magnesium, aluminum, lithium, and manganese which have either been extracted from seawater or mined as nodules on the seabed.

Protein Concentrate: Protein concentrate processed from marine life. A staple food product widely used on nonagricultural and industrial worlds. Most protein concentrates re sold in bland tasting (but nutritious) compressed cakes.

Organic Chemicals: These are chemicals extracted from marine life and used as fertilizers, explosives, or for other uses.

Precious Metals: Gold, silver, or platinum from sea water.

Water Vapor Condensers: Refrigerated systems designed to condense and collect water vapor from a desert world's atmosphere. These range from small portable units using canned chemical refrigerants to provide a water supply for one to three people, to large water recovery plants capable of supplying water to large farms or communities.

Hydroponic Farming Equipment: Tanks and nutrient supply systems used to grow plants in a soil-less environment. Used indoors, these make

economical use of water, and enable water vapor from the tanks and plants to be recovered and reused.

Desert Survival Suits: Skintight suits that prevent moisture loss and collect and hold water for drinking and other use. Available at TL9, they cost Cr500 and weigh 2 kg. A thermal cloak is included with the suit for protection against cold desert nights and to reflect daytime heat. These suits are vital equipment for travellers venturing away from settlements on desert worlds, and may be useful in other wilderness situations.

Stellar Power Systems: These consist of arrays of photovoltaic cells made from highly refined silicon. Stellar power systems range in size from 2 kg

systems containing 100 cells that are used to recharge batteries and power packs on wilderness expeditions, to massive orbiting arrays that beam power to world surfaces. They are also mounted on starship hulls and used as emergency power sources.

Synthetic Food Systems: Nutrient tanks, culture vats, pumps, and piping used to generate synthetic food from genetically engineered yeast cells.

Resource World: Roll on the resource world table for cargo information. Reroll if the result is "forest products."

All Terrain Vehicles: Same as standard ATVs, except these include a 1000 cell, 20 kg photoelectric power system capable of either powering the vehicle

during daylight on worlds orbiting a class K5 or

Re-roll if forest products result. Ice capped worlds will have no more than a trace atmosphere. Most inhabited worlds will have some type of cargo available, even if they are transhipments from another world waiting for an outgoing vessel. The general cargo table reflects this diversity, and is useful on any world, especially those with no trade classification. Roll 1D to determine type of cargo available. Then roll again for a specific cargo on the indicated world type table.

Terrence R. McInnes

Striker Weapon Systems Revisited

My previous article on **Striker** (**Journal of the Travellers' Aid Society** 21) studied the design systems for equipment in Book 3. This article will discuss the advantages and disadvantages in the use and organization of equipment that is already designed in Book 3 (mostly infantry equipment).

When considering infantry weapons, one must remember that there are two important statistics in infantry combat: penetration and accuracy. For example, if your unit has mostly assault rifles with effective penetration of 3, and your enemy has cloth

unit from being trapped in a helpless situation. Also try to arm the higher quality troops on the stand with the weapons without hit bonuses. When picking weapons, don't forget to have a decent range on vour weapons: a squad of troops with submachine guns might be nasty at close range (on board a starship or in a forest), but they would be cut down in most situations by riflemen who could "stand off" (another military term for your dictionaries) out of their range. The range question has also been a problem when deciding between the semi-auto rifle and the assault rifle (jamming rifles were not the only reason that some soldiers in Vietnam wished

armor with an armor value of 7, you will probably take heavy losses in any engagement while only wounding a few of them.

Accuracy is just as important, particularly when attacking an enemy in prepared positions. If the enemy is shooting from partial cover, you have to get at least two hits in order to have any effect (round half hits down, remember?). The -4 DM for infantry movement (charging the positions) doesn't help either. The problem is that after tech level 7, there is no weapon with sufficient penetration to keep up with the armor that still has an autofire bonus. You can't do much about it at tech level 7, but you should try to mix auto rifles and light assault guns (LAGs) at tech 8 9, ACR's and lasers at tech 10 11, and gauss rifles with energy weapons at tech 12 and above. This mixing prevents your

for the old M14 rifle over their M16's). Range should also make you think twice about using laser or energy weapons as general issue weapons.

Support weapons are usually designated as such because of their large weight and/or crew sizes. Support weapons can be machineguns, missile launchers, recoilless rifles, or even grenade launchers. Machineguns are good casualty producing weapons against infantry, but at tech 7 and above, body armor reduces their effectiveness, that is, if the enemy has such armor. In this case, grenade launchers usually supersede other weapons, often in the role as individual weapons (contact hits from HE rounds usually kill, and the frag hit may wound another trooper on the stand). Recoilless rifles are an excellent mix of long-range infantry weapons, causing damage in a manner similar to a

grenade launcher, and anti-tank weapons. However, once composite armor comes into being, their anti-tank effectiveness is limited to killing APC's. The recoilless rifle is a weapon that has no hit bonus, and so requires a high troop guality gunner.

When providing your infantry units with an anti-tank capability, a few HEAT rifle grenades are nice, but never depend on these. An infantry AT weapon should have good range, good penetration, and good accuracy in that order. What use are rifle grenades when you can't get within the 250m effective range to use them? The best AT weapons are package AT missiles. Use target designated guidance and a laser carbine if weight allows the assured hits are worth the extra cost.

Other weapons in the back of Book 3 include hand grenades (steer clear of these except in special situations; their range is terrible), bombs (very nasty, especially CBM types), nuclear warheads (we all know how good these are), body armor (this is always worth the extra cost, particularly if your opponent isn't expecting it), melee weapons (these are not worth the extra weight; just plan to use your rifles as cudgels; that is if you ever get that close), and communication/detection devices.

Commo/detection devices are very important to the game. However, the player must keep in mind that no system is perfect, and no countermeasure is perfect either. Let us first discuss detection devices. Radar is best used at tech levels 8 and below, but once ladar becomes efficient, use it to keep yourself from being open to jamming. No indirect fire unit should be without counter-battery radar of at least 10 power unless the enemy is known not to have indirect capability (a serious tactical error). Thermal imaging is an expensive option for tech levels 8 9, but is very much worth it maybe even for use on APC's. At about tech level 10, the cost of fusion tanks drops enough to allow them to carry extensive

ECM without a great addition to the cost, and infantry can use chameleon combat environment suits making thermal imaging useless. At this point, image enhancement should supersede it, supplemented by light amplification and ladar for the half decent night and limited visibility fighting ability. One note: all weather radar costs 50% more than a normal radar, but if you were to buy a radar of double the needed power (100% more than a normal radar, 33% more cost than an all weather radar), you would have the same limited visibility capability, but the double power radar would be superior in normal use. For infantry, all stands should have light amplification when it becomes available, but IR devices are too short-ranged for general use. A better option is to put active I R scopes on the support/heavier weapons. Of course, once combat and power armor come into being, it becomes cost efficient to put image enhancement and even low power radars on infantry stands.

Communication is an important part of any unit, but is not that important in combat situations: a deliberate assault should be pre-planned and should not allow time for receiving any orders other than code words. Communication is most important in garrison type situations, where units are waiting for new orders. This type of deployment is often very similar to an unplanned defense, and if such a unit were attacked, orders would have to be given to set up a strategy as you go along. Communication devices are either defensive or offensive/defensive in nature. Defensive communicators include wire and laser/maser communicators not linked to battle computers. These devices cannot move without disrupting communication. Offensive devices are either

radios or laser/masers linked to battle computers (we shall ignore meson communicators since, once they come into being, all communication problems disappear). The problem is that laser/maser types linked to battle computers are mostly used on vehicles of tech level 9 or higher. Radios are nice, but a unit still needs one of these "sure" types of communication, even infantry. You can't do much about radio jamming at tech levels 5 6, but once laser/masers come in, use them.

Commo/detection countermeasures such as jammers or locaters linked to indirect fire units should be employed at high levels in the unit. A company sized unit only needs one radio jammer, one radar jammer, and so on; no more.

Lastly we have engineering equipment. This type of equipment should not be issued to everyone, such as mine sniffers and dozer blades on each tank, but instead used in specified engineer units. Most antiminefield equipment is not needed since minefields are not usually well camouflaged and are not big enough that it would take more time to drive around them than to get an engineer unit on line to remove them. Line charges on vehicles are also a good alternative to clearing mines manually. Bridges are a

tactical disadvantage, but are necessary for main battle tanks of tech level 7 and below. Look at it this way, if you have to cross any rivers, your unit's mobility is tied into the bridge you are carrying. What do you do if the vehicle carrying your bridge gets shot up, go home? At tech level 8 and above, nongrav main battle tanks should be an ACV type, or be able to float.

In conclusion, when picking from the pre-designed equipment in Book 3, think about the tactical applications. Is there a better way to get around it? Imagine the worst possible enemy weapons, enemy deployment, and enemy countermeasure. The first thing a U.S. Army leader learns about strategy is to imagine the worst and prepare for it and that way you'll never be surprised.

Steven P. Drevik

Writing a computer program to do some of **Traveller's** basic procedures is a relatively simple process. Because the procedure itself is simple and easily understood, anyone conversant with Basic can probably make a

A Comprehensive Sector Generator

program work with a minimum of effort. Writing such programs makes it possible to avoid much of the tedium associated with generating large amounts of **Traveller** material: making one world can be fun, but making a thousand is not only time consuming, it is also tedious.

So, why aren't there a lot of **Traveller** programs out there now? Several reasons apply, but I'll deal with two.

First, writing polished programs that do a job precisely and easily is more work than it looks. People's preferences vary. Some want programs that exactly mimic the procedures in the **Traveller** rules. Others want their own special rules, variants, or exceptions included (or they want to at least be able to program them in). Still others want to be able to control the die rolls. Still yet others feel that they need a certain degree of user friendliness.

All of this makes each individual programmer unwilling to expend a lot of time on the project. If he does (and some have), then others may not accept the program because of its peculiarities.

The second major consideration is data format. Once information is generated, it is shown to screen or printer, or written to disk. But without a standard format for saving the data to disk, the information cannot be massaged, analyzed, reproduced, or shared with others.

On the other hand, if a standard data format is available, any number of programmers can write programs that not only produce data, but they can also share that data and the programs that produce it.

STANDARD FORMAT

Under the guise of presenting a program that generates **Traveller** world UPPs, my column for this issue defines a standard format for world UPPs. With a standard format, anyone can be sure that the results of a program they write can be shared with others (given only a compatible computer or computer link).

The Standard UPP Format for worlds saves basic data generated in accordance with world generation rules in **Traveller**.

All data for a sector is contained in one file (if disk space or available memory precludes it all being in one file, two or more may be necessary). Each record in the file is one world UPP.

Each record is divided into six fields:

Hex Location: Bytes 1 4. The hexagon location of the world within a sector map. Values range from 0101 to 3240.

UPP: Bytes 6 14. The actual generated UPP. Byte 6 is starport type; byte 7 is world size; byte 13 is always a hyphen (); byte 14 is tech level.

Bases: Byte 16. A single code letter for any bases in the system.

Trade Classifications: Bytes 18 32. Up to five 2 letter trade classifications can be held in this field. Each classification is separated from the others by a

space. It is possible to generate some of these trade classifications from the world UPP, but they are computed and included as part of the world data to allow quick scanning and analysis of the data.

Allegiance: Bytes 33 34. A 2 letter code for the interstellar government which claims the

allegiance of the world.

Travel Zone: Byte 36. If the world is travel zoned, then this field holds the letter A (for Amber) or R (for Red).

Gas Giant: Byte 38. If the system has one or more gas giants, then this field has a G.

Tradeworld: Byte 40. Reserved for later use. **Explored?:** Byte 42. Reserved for later use.

THE PROGRAM

The computer program listing handles basic world generation. It produces a complete sector and saves the data to disk. It can produce as many sectors as you want; all will be standard Imperial worlds.

The text file output is accessible through many text editing programs. The following program will read it from disk and place the data in the array A(N) where N is the record number of a specific world. You can incorporate it into your own programs. For example, you could write a routine (put it in lines 2000 2999 and delete line 1130) to examine the entire array and find the highest population (or government, or tech level, or law level) world.

1000 INPUT"FILENAME? ";FI\$ 1010 PRINT CHR\$(4);"OPEN ";FI\$;",L50" 1020 PRINT CHR\$(4);"READ 11;FI\$;",R0" 1030 INPUT R 1040 DIM A\$(R) 1050 FOR A=1 TO R 1060 PRINT CHR\$(4);"READ ";FI\$;",R";A 1070 INPUT A\$(A) 1080 NEXT A 1090 PRINT CHR\$(4);"CLOSE" 1100 FOR A= 1 TO R 1110 PRINT A\$(A) 1120 NEXT A 1130 END

Sector Generator also saves a parameter file (with the same filename suffixed with an @) which is compatible with the file editor program contained on the Trader, WordGen, and Beastiary disks. The file editor lets you get into the data and manipulate it directly.

DECODING THE DATA

The Data Format page shows what all the data (actually more than this program produces) means. It is a compilation of basic data taken from a variety of **Traveller** sources.

Marc W. Miller

DATA FORMATS

The information produced by the Imperial Interstellar Scout Service is provided in specific formats in order to allow quick and easy access to the data.

Data is grouped by Sectors, corresponding to sectors of the Imperium and of surrounding space.

Data Codes: The data in the UPP and in associated fields is coded to hold the maximum amount of information. This guide shows the basic interpretation of the codes used.

World UPPs

World UPPs (Universal Planetary Profiles) are constructed of eight discrete digits or characters in order to provide a quick readout of the basic information about the world. Each segment of the UPP is one digit or character. The data is presented in the following order:

Code	Description
Starport	Type of starport facility on world.
Size	World diameter (in units of 1,600 kilometers).
Atmosphere	World atmosphere type.
Hydrographics	World surface covered with water (in tenths).
Population	Exponent of intelligent population.
Government	World government type.
Law Level	Degree of oppression by law.
Technological Level	Level of technological achievement.

Starports Code Starport Type A Excellent Quality, Refined fuel available, Annual maintenance overhaul available. Shipyard capable of constructing starships and non-starships present. Naval base and/or scout base may be present. Good Quality. Refined fuel available. Annual maintenance overhaul available. Shipyard capable of constructing non-starships present. Available: Shipyard capable of constructing non-starships present. Navailabase and/or scout base may be present. Routine Quality. Only unrefined fuel available. Reasonable repair facilities present. Scout base may be present. Only unrefined fuel available. No repair facilities present. Scout base may be present. Frontier Installation. Essentially a marked spot of bedrock with no fuel, facilities, or bases present. No Starport. No provision is made for any ship landings.

Starport indicates the best quality starport in the star syste

World Size Data					
Size	Diameter	Mass	Area	Gravity	Esc Vel
1	1,600	.0019	.015	.122	1.35
2	3,200	.015	.063	.240	2.69
3	4,800	.053	.141	.377	4.13
4	6,400	.125	.250	.500	5.49
5	8,000	.244	.391	.625	6.87
6	9,600	.422	.563	.840	8.72
7	11,200	.670	.766	.875	9.62
8	12,800	1.000	1.000	1.000	11.00
9	14,400	1.424	1.266	1.120	12.35
A	16,000	1.953	1.563	1.250	13.73

Size is the size code from the Universal Planetary Profile (UPP) and expresses the diameter of a world in approximately 1,600 km units (or 1,000 mile units). Diameter is in kilometers. Mass is in Earths (Earth = 1) and assumes a density similar to Earth (5.5 grams per cubic centimeter). Area is in Earths (Earth = 1). Gravity is in Gs (Earth = 1). Escape velocity is in km per sec.

Atm sphere Code Description No atmosphere. Requires vacc suit. Trace. Requires vacc suit. Very thin. Tainted. Requires combination respirator/filter Very thin. Requires respirator. Thin. Tainted. Stellar Data

Stellar Data indicates the spectral class and size class of stars in the system Up to three stars may be present and information shown on them

9	Stellar Type					
-	Code	Description	Temperature			
	B	White	14,200-28,000			
-	A	Blue-White	8,000- 9,900			
	F	Yellow-White	6,100- 7,400			
_	G	Yellow	4,700- 6,100			
	K	Orange	3.300- 5.000			
-	M	Red	1,900- 3,600			

Stellar type indicates the spectral classification of a star; colors are the essen tial perceived colors of the star's visible light. Temperature is given in degree Kelvin.

	Stellar Siz	0
Code	Description	Diameter
la	Bright Supergiant.	52 -3500
lb	Weak Supergiant.	30 -3000
11	Bright Giant.	14 -1000
101	Normal Giant.	4.6- 360
IV	Subgiant.	3.3- 13
V	Main Sequence Star.	0.2- 10
VI	Subdwarf.	0.1- 1.2
VII	White Dwarf.	0.006- 0.018

Stellar size indicates the radius of the star expressed in solar radii and show the relative differences to be expected.

Base Codes

Base codes show the presence of military bases in a system; special code deal with the presence of more than one type of base within the same syste in order to maintain a single base code letter per system.

Tournament

The resort complex of New Arcadia on Thalia offers a highly varied menu of ways in which visiting dignitaries can relax. Various facilities are provided for all manner of physical or athletic pursuits, social events, and the like. A wide range of stimulating mental diversions is offered as well, one of the most unusual being a large scale wargame called Tactics Twelve.

Like all wargames back to the earliest known versions, this game casts the opponents (interested guests paired randomly by computer) in the roles of generals commanding certain specific forces. What makes this game unusual,

however, is the fact that the game is conducted over a stretch of actual terrain covering some 100 square miles of wilderness, using

actual military units to execute battle plans.

The management of New Arcadia has worked out special arrangements with several mercenary units, which provide the troops employed in the games. The maneuvers serve as training exercises for the troops, giving them valuable experience in actual combat situations without the danger of losing men in the process ... for the new Arcadia operation is fully computerized, with the weapons issued firing low power, non lethal laser beams which automatically register on suitable targets (light sensitive fabrics incorporated in uniforms and the like) and determine the success or failure of each man's fire. Casualties are notified to discontinue action (their weapons are automatically inactivated). In this way, the effects of combat are well simulated, providing one of the best possible training grounds for combat available.

In return, the resort gets the ability to stage these elaborate games, giving guests with military interests a chance to act as a general, safe and secure in a headquarters bunker, watching as his operations unfold. It is an expensive but immensely popular extension of an ancient hobby (wargaming) and has made New Arcadia one of the most popular (and profitable) resorts on Thalia.

Referee's Information:

This is a sort of "make your own" Amber Zone. The full scale wargames at New Arcadia have a variety of interesting applications to a **Traveller** campaign.

First off, a group which is just getting into **Mercenary** or **Striker** activities on a level of anything up to regimental size might be hired to play/train at New Arcadia. The referee can set up any of a number of "mercenary tickets" which reflect different game situations. Campaigns using **Mercenary** and battles resolved according to **Striker** can then be staged. The participants, when put out of action, are not killed, merely removed from the action until the game is over.

The referee will find in this an excellent way to allow players to learn how to handle **Mercenary** or **Striker** operations before actually entering a battle where

their decisions will destroy a unit carefully recruited and equipped after years of work and effort. Weak links in unit organization can be corrected, and, most importantly, the players can acquire some of

the experience their characters are supposed to have earned ... often an important consideration in complex roleplaying such as goes into **Traveller** military operations.

Used in this fashion, the situation is something of a planetbound **Trillion Credit Squadron** adventure. It offers, though, little in the way of physical danger for the adventurers, and could be considered rather dull by some.

However, other problems can be interjected as desired to spice things up. Characters might be hired to covertly assassinate or protect a particular guest at the resort, whose passion is wargaming. It may then become necessary to infiltrate the game to gain access to his command bunker.

To set up a game, the referee should give each side equal or roughly equal forces (not necessarily identical, but carefully balanced ... for instance, one side

might have a handful of spotter aircraft, while the other would balance this with light armor). Tech level is agreed upon, and the terrain chosen. The referee then defines the missions of each side; generally, each force will have both an offensive and a defensive objective, testing both ends of a commander's ability. Resolution is by the appropriate set of rules. If desired, though, almost any conventional wargame (such as GDW's **Assault**, as an example) can be adapted to use as a representation of the resort wargame.

Primarily interesting as a background diversion, this situation offers some interesting possibilities for introducing military operations into a **Traveller** campaign in an unusual and intriguing way.

John Marshall

Shield/Dome: Shields are formed from free flowing, low viscosity lavas. Examples are Mauna Loa on the Hawaiian Island of Oahu and Olympus Mons on Mars. Domes are high viscosity lavas. It's easier to visualize if you think of the lava as cold toothpaste being squeezed out of a tube. Both the shield and dome volcanoes have slopes of 6 12c'.

Composite: The composite type is also called the strato volcano. It has alternating lava flow and pyroclastics beds. Pyroclastics are the solids ejected during an eruption which range in size from ash to boulders and are not part of the original ground or the volcano if it is re-erupting. Examples are Etna in Sicily, Fujiyama in Japan and Vesuvius in Italy. Slopes are of a wide range but tend towards the 301 of the cinder cone.

The type of cone you find will tell what the general area is like geologically. Continental volcanoes are composites (the most common) and domes. Oceanic volcanoes are mainly shields. Cinder cones occur both on continents and oceans (as in some of Iceland's recent additions).

DANGERS

Different volcanoes exhibit different characteristics, and have different dangers. Among those encountered around continental volcanoes are the nuee ardente, the lahar, and the maar.

Nuee Ardente: A particularly dangerous volcanic event is the nuee ardente. These rapidly moving, 100+ kph, events are from composite or cinder cones. They are made of hot ash and dust suspended in gases from the eruption. These gases buoy up the ash and dust so the low frictional resistance gives a very high speed. They have temperatures of about 8001 C. The classic example occurred in 1902 on the island of Martinique. Mt. Pelee erupted, releasing a nuee ardente, killing 28,000 people and burying most of the city of St. Pierre.

It should be obvious how dangerous this event can be to the intrepid adventurers. A vacc suit can save you from suffocating on the ash and dust (which is what kills most of its victims) but with speeds of up to 100 kph, you still could get buried alive and possibly roasted (depending on the heat resistent qualities of your vacc suit).

A more disastrous possibility is for your spaceship to be buried under a few tons of ash and dust. Few ships are designed to take this kind of punishment.

Lahar: A related occurrence to the nuee ardente is a lahar. Lahars happen when a nuee ardente meets a body of water, usually a lake or river, and forms a mudflow or a landslide. The speed is reduced to about a third, and the temperature is cut down several hundred degrees, but they can still entomb unwary adventures in thousands of tons of boiling hot mud. In addition, lahars can carry large boulders tens of kilometers in a few minutes.

Maar: These are shallow, round, pit like depressions, about a kilometer in diameter. They can often be filled with a light layer of their own ejecta (ash and pyroclastic material), and are not easy to spot unless you know what to look for. Fortunately, these formations are very rare.

VOLCANOES

Any world, if it is to be of interest to the players, will have potential natural as well as manmade dangers. Natural dangers are not just plants and animals. They also include things like climate, planetquakes, and volcanoes.

This article will deal with volcanoes, describing a few salient facts about them, and giving some suggestions on how they can be realistically portrayed in a **Traveller** setting.

VALUE

Volcanoes bring deposits of valuable materials and chemicals to the surface. These include gold, radioactives, and other metals, in addition to more mundane things like pumice or sulfur and others. Volcanic areas can also supply large amounts of geothermal energy, and large power plants may be located in these regions.

TYPES

First, there are three types of volcanoes, cinder cone, shield/dome, and composite.

Cinder Cones: Cinder cones are formed when fragmentary material is explosively ejected from a volcanic vent. Large particles will profile up to 300 (from ground level) while small particles, no more than 101. The slope can be important if the adventurers need to climb a volcano for some reason. The volcano in Paricutin, Mexico, which formed in a peasant farmer's field in 1945, is a good example of a cinder cone.

Maars erupt irregularly, off and on, with very little warning (picture a giant Saturn 5 engine, turned upside down and ignited, and you'll have a good idea of what one of these things can be like). Maars can occur in groups, but they don't all erupt at the same time. A field of them is not unlike a minefield with the mines going off one at a time at random. Since they were first noted and described in Germany, the word maar comes from the German word for lake. The maars in Germany went extinct and later filled with water to form lakes. It is very easy to mistake a maar for a meteor crater.

"...picture a giant Saturn 5 engine, turned upside down and ignited..."

Oceanic volcanoes present as many dangers to a planetbound party as continental ones. Remember that oceanic volcanoes only originate underwater; they can rise thousands of feet above the surface. Oceanic lavas are free flowing

(remember shield volcanoes) and form three types of landforms: pahoehoe, Aa, and pillow lava.

Pahoehoe: Pahoehoe (pronounced pa' hoy hoy) is highly fluid and spreads in sheets. A thin, glassy, elastic skin forms at the surface and is then dragged into ropey, filamented folds as the fluid lava flow continues underneath the solid surface. Pahoehoe is Hawaiian for "ropey".

Aa: As pahoehoe flows it loses volatiles and becomes a more viscous lava which forms a type called aa (ah ah) which is Hawaiian for what a bare-footed person says when walking on it (really!). The reason for this is that aa lava hardens into an incredibly rough, jagged, clinker like surface. A good set of boots will not last more than a week. Aa also tends to be blocky, with pieces from football to house size which can shift unpredictably.

Hopefully, the ill equipped or clumsy character will have a good medic nearby if he or she falls down. Aa can easily cut a vacc suit or ballistic cloth armor or jack

(about a 50% chance of a serious mishap). A field of aa type lava is also not the place to have a belly landing, either. The rough, jagged surface will do the ship's hull very little good.

Pillow Lava: Pillow lava is formed when molten lava hits water. This is not very hazardous unless you get too close.

THE BIG BLAST

spectacular phreatic (steam blast) eruptions. These occur when the superheated steam and other gases, build up to colossal pressures, causing a massive explosion. The blast (not unlike a nuclear explosion) throws tons of volcanic ash and pulverized rock into the air, often significantly changing the shape of the volcano itself. After the eruption the volcano can reform (as Krakatoa is doing now).

Even more dangerous than anything vet mentioned is the much rarer and most

The danger to any adventurer is obvious. Such an eruption is dangerous to people at great distances, not to mention any ships on the surface nearby.

The most famous phreatic event was Krakatoa, in the late 19th century. That blast has been estimated at 100 medatons The sound was heard 2.000 miles away in Australia, a sea wave 40 meters (130 feet) high was created and registered as far away as the English channel. The dust was blown so high in the atmosphere that weather patterns were changed slightly (deep-red sunsets were seen for years as well). Although less famous, the eruption of Tamboura in 1817 ejected enough dust into the atmosphere to cause the so called "Year Without a

> Summer," where snow fell in New England in June. Even larger blasts have taken place in prehistoric times. A more recent event, Mount St. Helens, was a mere burp by comparison.

ACTIVITY

To complicate matters, volcanoes can be active, extinct, or dormant. It's easy to spot an active volcano ... most of the time you just have to look at it. If not actually erupting, it is usually smoking (Mauna Loa in Hawaii, for example).

Extinct volcanoes are not a concern; they are harmless mountains of rock. The problem comes in telling if a particular volcano is really extinct or just long dormant. There is no easy, short test than can be applied ... you just have to study a particular volcano for a while.

Mt. St. Helens is a good case in point. Inactive for decades, the volcano suddenly began pouring forth steam and shaking the ground. This went on for some time, but even the best scientists on the scene couldn't say exactly when St. Helens was going to erupt. The final event was sudden enough that several geologists were caught in a helicopter when it finally blew.

A CLOSING NOTE

For anyone who becomes too confident in their geology skill, consider the following. On May 7, 1902, Professor Landes of St. Pierre's College said, in a statement issued to calm the populace: "The Mountain Pelee presents no more danger to the inhabitants of Saint Pierre than does Vesuvius to those of Naples." On May 8,1902, at 8:02 A.M., Mt. Pelee released the aforementioned nuee ardente which wiped out Professor Landes and 28,000 others.

Brent Reck

The Prt' are a minor race evolved from once domesticated carnivore/pouncers. They are bipedal, but can move on all fours at greater speed. Averaging about one meter in height and 25 to 30 kilograms in weight, their most distinguishing feature is a slight external resemblance to the Felidae (cats) of Terra, causing one observer to characterize them as "over grown tomcats".

The main differences between the Prt' and their wild forebears are a greater overall body size, an

enlarged cranium, and the development of the forepaw into a stubby fingered hand, allowing the manufacture and use of tools. The greatest difference of all is, of course, their sapience.

The Prt' (Pronounced "Pert" with a rolled "R' and emphasis on the "t") inhabit a world in the Spica sector known to the inhabitants and to the Hivers (with whom the Prt'are affiliated) as Prt'aow. This word translates to mean "Home". Note: The pronunciation of this word is subtly different from the reference to one's dwelling, referring instead to the dwelling place of all clans.

The Imperial reference to this world is Spica/Prt' (C9667C9).

BACKGROUND

The Prt' were created by a race they refer to as the Hasst'kor (literally "those who came before"). Known only through old legends, the Hasst'kor seem to have bio-engineered simple carnivore/pouncers for use as a servitor race, giving them manipulative ability and greater mentality. For an unknown period of time, this was the Prt' existence: servants.

Approximately 10000 Imperial, the Hasst'kor were destroyed in an interplanetary war with their neighbors. This catastrophe has eradicated the Hasst'kor and left the Prt' as the only intelligent life on the planet, their population drastically reduced by chemical assaults and the bio plagues which destroyed their former masters.

The Prt' took to the wilds to avoid the major concentrations of the deadly chemicals and diseases. For millennia, they lived a brutish, primitive existence, slowly evolving their own culture.

As time passed, a few scouts entered the devastated ruins of the former civilization.

At first, those who dared to enter either came out or died shortly thereafter of various diseases, remnants of the biological weapons.

Eventually, a few survived and returned. Because of the fact that those who entered the ruins often brought death back with them, they tended to be ostracized and treated as outcasts. With the passing of time, outcasts who did not die as a result of their forays formed clans of their own. They moved into the ruins, where some examples of technology lay preserved in stockpiles and caches (the Hasst'kor were a cautious race, and had emergency stockpiles laid by in case of less devastating attacks by their neighbors). These "civilized" clans prospered, advancing to TL 1 while the rest of the planet remained at TL 0.

Approximately -2400 Imperial, a Hiver expedition discovered the planet and its emerging race. Contacting a few recklessly curious clans, the Hivers had a rather

typical reaction to primitives (for them, anyway), deciding that the Prt' needed uplifting to a civilized level. Soon, the Prt' were accompanying the Hivers on scouting expeditions through the stars. To this day, despite their somewhat violent ways, the Prt' remain very active in both Hiver exploration services.

Concerning the Hasst'kor: Hiver archaeological expeditions have yielded little knowledge on the original inhabitants of the system. It is clear that two planets, the third and the fourth, were occupied by sentient races.

Those of the third were the Hasst'kor, a race of roughly Solomani size and shape. More of their physiology is not known; apparently they did not have a habit of portraying their form or likeness in art, at least not in a form which could survive the centuries; their anatomical/biological records also deteriorated long ago.

Their technology was roughly TL 9, but they had not discovered jump drives. Their bio-technology, however, evidently rated about TL16; they were superb bio-technicians.

Of their mentality and philosophy, the only remaining demonstration is the condition of the fourth planet. Its surface is almost entirely stripped of life and pockmarked with huge craters. It is hypothesized that crude anti-matter ordnance was used. (Of the race which dwelt there, only the barest traces remain.)

SOCIETY

Prt' society is dominated by the clan system, similar to, although not as restrictive as Aslan clan hierarchy. Government is by a council of clan elders, who hold frequent meetings to decide policy for a population a rather sporadic form of government. These elders also decide policy for their individual clans: male elders making most of the decisions, with final approval coming from the females. For the day to day paperwork that every functioning government had to deal with, there is a clan which specializes in bureaucracy and dealing with off worlders (it is not a very large clan).

It should be noted that every surviving Prt' who reaches old age (60+ years) becomes an elder of his or her clan. Some Prt' are honored with the status of elder when they are as young as 40; usually this honor is bestowed for the performance of some great service to the race, or the amassing of popular or political power.

The armed forces of the planet are also clan maintained, with the vast bulk being volunteer militia, formed from the very argumentative populace. The primary function of the armed forces, since space and interstellar defense is provided by the Hiver Confederation, seems to be frequent competition between clans to determine which unit is the most impressive. These wargames also serve for the Prt' equivalent of organized sports.

One other clan event of interest is the Kha'i (rite of passage), a ritual combat that marks the entry of a male Prt' into adulthood. Held biannually between clans, adolescent males compete against one another to prove their strength and suitability as mates: a function still served by this tradition, as many females have their selections influenced by the displays. Males not selected often leave their

clans for a time to further prove their suitability by questing in unknown territory. With the entire planet explored, this often translates into starfaring. (Females coming of age also have the right to leave the clan, but few do so.)

INTERSTELLAR RELATIONS

Prt' is a member of the Hive Confederation, and Hiver influence is pervasive. (The written language of the Prt' is the Hiver idiographic system.) Although not one of the most influential members of the Confederation, the Prt' can boast of their contribution to the Hiver Exploration Service.

Their closest neighbors, the Solomani, retain friendly (if somewhat patronizing) relations with the Prt' government. On the whole, the Solomani are not favorites of the Prt', due to the Solomani characterization of the Prt' as large housecats.

Even though the Imperium is somewhat distant from Prt'aow, the Prt' are familiar with it, and many have gained Imperial citizenship through service in the Imperial Scout Service, a favorite among the Prt'.

Two entire clans of Prt' have moved to the Aslan Heirate, where they serve as assistants to Aslan corporations and clans, usually as interpreters in human Aslan meetings. The Aslan appreciate the Prt' ability to tolerate human insults and gaffes without becoming mortally insulted (Prt' can still be considered "touchy" from a human standpoint, however). Occasionally, Prt' have served as mediators between Aslan clans, being recognized as neutral parties.

PLAYING THE PRT'

Three character traits are most prevalent in the Prt': curiosity, independence, and pride. The sometimes irrational urge for knowledge often gets Prt' in trouble, but it endeared them to the Hivers, who share similar urges. A Prt' character should be played intelligently, but always wanting to know what's happening, what's happened, and what lies ahead.

A Prt' is not likely to be tolerant of insults to his person or clan, with response ranging from return insult to violence, though those who have spent time among other races tend to be more willing to learn, realizing that their small size causes others to have trouble taking them seriously (often, females are less touchy than the males). Still, typical Prt' reaction to obvious insult tends toward a slap in the teeth (if they think they can get away with it!).

The Prt' love of independence counters much perceived clan authority. Although they still retain some responsibility to the clan, a Prt' sense of duty to clan and family exerts less pull with distance. Respect for authority other than clan/family is even less; Prt' have a tendency to ignore orders unless they want to obey them.

Other Salient Quirks: In mixed groups, Prt' males are rather protective of their females. Depending on the independence of the female(s) in question, this protectiveness can be rather annoying. As noted before, they're a race of individuals. And finally, few Prt' appreciate the wasted effort of bureaucracy and red tape, generally perceiving it as a waste of their time and effort.

to enlistment in pirates, belters, rogues, hunters or barbarians; 4 to any other unlisted service).

Aging rolls start at age 40, with a DM of +1 on all rolls. Every two years after 40, aging rolls are conducted again.

Prt' may have any skill except equestrian (treat as hunting) and blade combat (treat as spring claw skill below); they may, however, refuse to accept administration skill (unless mandatory) and roll again (if they get it on the second roll, they're stuck with it).

The Prt' must use specially modified weapons, and use human or Aslan weapons at 3 DEX (and need both hands to do so!). They prefer low recoil weaponry, such as lasers and rocket weapons. The cost of the special modification ranges from + 25 to + 50%. Also, the modification makes firing Prt' weaponry difficult for any race with large hands (-2 DEX for most races).

The Prt' have a specialized weapon similar to the Aslan ayloi. This is called Korrt'u Hasst'kor (the gift of the Hasst'kor) although they are usually referred to in Galanglic as "springclaws." Although all Prt' have natural claws, many males prefer the added power of the device, which is a set of three blades 12 15 cm long contained in a harness which covers the wrist and the back of the hand. Normally recessed into the harness, the blades spring out with great force to extend beyond the hand when triggered by the wearer 2D damage). Following this action, they are employed like normal claws, but with greater effect (treat as blade). Brawling skill is a -DM for Claw and Spring Claw use, since the Prt' hand-to-hand combat can by no means be considered an art form (you get in close and buzz saw the victim).

REFEREEING THE PRT'

Prt' characters are generated like regular **Traveller** characters, except that strength and endurance are rolled on 1D+2 and dexterity is rolled on $2D^*$ 2. Maximum Strength that can be attained is 10; maximum Endurance attainable is 11.

Dexterity is handled differently than usual: A Prt' is very agile, but the stubby fingers allow them only middling manual dexterity. In matters of delicate manipulation, such as weapons fire, the listed DEX score is used; when physical agility is in use, the DEX score is treated as if it were six (6) points higher.

Prt' enter service at age 16, due to fast maturity. They tend to join the Scout Service in some capacity. Scouts are the Prt' most likely to be encountered outside Spica or Dark Nebula sectors. Rarely, Prt' become merchants, or (if female) scientists (-1 to enlistment). Few choose other types of employment (-2

Military Academy: A Traveller Variant For 3-8 Players

Referees will need **Traveller** Books 1 5 and Supplement 1, **1001 Characters**. The GDW game **En Garde** is also useful, though not essential. The novels "Space Cadet" and "Starship Troopers" by Robert A. Heinlein, "We joined the Navy" by John Winton, "Officer Factory" by Hans Kirst, and "Battle Cry" by Leon Uris are also extremely useful sources.

INTRODUCTION

This article contains rules to simulate the interactions of a group of military cadets in the Imperium, through a four-year training period. it can be run as an isolated game or as a role playing addition to the extended character generation procedures in **Traveller** Books 4 5. It is assumed that all player characters are natives of the planet Beauville, a rich agricultural world and have joined one of the Imperial services as officer cadets. It is advisable that players should not be allowed access to this article during play.

BACKGROUND

Beauville (A867744 C N, Rich, Agricultural, G) is a Terra normal planet, strategically located at the junction of two trade routes, which exports fine foods and wines to the Imperium. The subsector was originally settled by Solomani colonists under the Rule of Man, but is now integrated into the Imperium. Traces of the Solomani influence still linger, especially in place names and the customs of the planet, which include a code duello.

There are 45 million inhabitants, but most land and wealth is owned by a fairly small hereditary aristocracy. Though Beauville is nominally a democracy, these landed families have immense political power, since their employees tend to vote the way the family directs.

The Navy base indicated above combines normal facilities with the subsector recruiting and training establishments, including installations in space and on other worlds of the system. Though not shown in the planetary statistics, there are also Marine and Army installations of comparable size and purpose. The Imperium operates an experimental officers training school in this subsector, in which the services recruit officer cadets for prolonged training before final placement at rank 01. This system supplements and operates in parallel to the normal service career structures, which are also used in the sector. It is customary for the younger children of the aristocracy to join one of the services as cadets. The poorer population may also apply, but most lack the education needed to succeed. The few of the lower classes who manage to enter the services as cadets tend to become the butt of their classmates' humor, subject to jokes and humiliation.

PRELIMINARY CHARACTER GENERATION

The Army, Marines, and Navy all use a similar system of officer recruitment on Beauville, with approximately 50% of candidates internal promotions from the ranks, the remainder college training scheme graduates and cadet applicants. It is assumed that all of the player characters fall into the last category.

Characteristics: Characteristics are generated normally, except that social status must be rolled before education, which may be no higher than SOC + 1 (SOC +3 if INT 10+). This reflects the link between social status and wealth on Beauville, where there is no free education and very few scholarships are available.

Service: The referee selects the service to be used, from Army, Navy, or Marines. The Scouts and Merchants do not operate similar training schemes.

All players are assumed to have been accepted for training in the cadet corps of the service selected.

Skills: Assign the following preliminary skills:

Blade Cbt 0,	Gun Cbt 0,	Carousing 0,
Gambling 0	Brawling 0,	Streetwise 0.

Blade Combat must be taken as Cutlass 0 in the Marines, Foil 0 in the Navy, and Blade 0 in the Army.

Gun Combat must be taken as Auto Pistol 0 or Revolver 0.

The level 0 skills above cannot be improved except through normal end of year skill allocation. However, the referee should note any skill which is used successfully a number of times in the term. At the referee's and player's

discretion such skills can be improved in preference to allocating a randomly rolled skill from the normal generation system.

Funds: Each character has SOC x Cr500 available as savings, plus monthly pay of Cr450 and monthly income of SOC x Cr50 in allowance from family and other sources, such as investments.

Each character is issued two cadet uniforms, replacements cost Cr100.

CLASS STRUCTURE

Each Academy enrolls 180 students per year, in six classes of 30. Four classes are reserved for promoted other ranks and college graduates (mostly from other systems); the other two consist of officer cadets with no prior military experience. It is suggested that all player characters belong to one of these two classes. Most interactions will take place within the cadet classes in each of the four years, and encounters with other non-cadet students are relatively unimportant. Other cadets in the class should be generated randomly, using the following guidelines:

3D6 cadets are off-worlders, whose characteristics should be rolled randomly. At the referees discretion this group may include 1D6 -1 non humans of races loyal to the Imperium.

The rest of the class are natives of Beauville, and should be rolled as in the first part of this rule.

At this stage, the referee should assign names and incomes to all NPC's.

Peer Status: Determine the peer status (PS) of each character (player's and NPC's both) by the following formula:

 $PS = (2 \times SOC) + (I NT/2) + (STR/3)$

All fractions should be rounded down, and off-worlders suffer a penalty of 1D6, aliens 2D6. Peer status represents the character's position in the cadet pecking order, and is comparable to REP in **Traveller** adventure 8, **Prison Planet**. It is advisable that characters should not know their own PS or that of other characters, but should be told that they "feel" that another person is somehow a superior or an inferior. Actions which affect PS must be witnessed by at least one other cadet before PS is altered.

Academic Status: Determine the academic status (AS) of each character (players and NPC's both) by the following formula:

 $AS = (2 \times EDU) + Q \times INT) + SOC$

This rating represents the characters status with instructors, examiners, etc. It can be influenced by study, demerits, athletic prowess, the assumption of voluntary duties, etc. Players should not be informed of their AS or that of other characters.

Senior Cadets: A senior cadet with four years service and D6 skills will be assigned to the class. This character is a native of Beauville, and should be used to brief the cadets on unofficial details of college life.

Tutor: A tutor (officer) with 2 4 terms service is assigned to the class. This character should be generated from the appropriate rule book, and is not a native of Beauville. This NPC hands out rewards and punishments, and tells cadets about special events and assignments (see section 6 and 8 below). Tutors and other staff are not involved in the Peer Status system.

Other Classes: Referees may wish to generate the second cadet class for the entry year, and cadet classes for years 2 4. This is not essential but adds realism. Class size tends to decrease by 10% per year. A suitable compromise is the generation of a few important cadets (a bully, the cadet pentathlon champion, a science student with a habit of blowing up the laboratories, etc.), plus a few interesting teachers and instructors.

THE ACADEMY YEAR AND ACADEMIC LIFE

The cadet course runs for four years, each year consisting of eleven months work and a months leave. The first three and last two months of each academic year are devoted entirely to class work, with months four to nine reserved for detached duty. For simplicity each month is assumed to last four weeks. Cadets based at the academy are subject to strict discipline, and are expected to wear correct uniform at all times and to behave as officers in matters of obedience and honor.

Schedule: Cadets are expected to work from 0800 hours to 1800 hours each day of a six day week, with a one hour lunch break. The seventh day is left for private study, sports, and other activities.

Cadets are assumed to spend all their working time in classes, or using laboratories and other study facilities. Cadets wishing to avoid classes must make a saving roll of INT or less to avoid their absence being discovered. Classes are allocated in one hour units; each unit in which a cadet is known to be absent will result in the loss of D6 AS, and in the loss of 1 2 points PS, since other cadets will assume the character has been careless to be caught. Avoiding lunch involves no problems.

Extra Curricular Activities: Cadets with AS of 70 + are allowed to leave the academy grounds in the evening but must return by midnight. Each evening out costs one AS point. Cadets returning after midnight lose 1 AS point per 10 minutes overdue, but gain one PS point per full hour overdue.

Cadets with AS of 60+ may leave the academy grounds at any time on their rest day, without point penalty, but must again return by midnight.

Free Time: Each cadet has six evenings and one day available for additional studies, recreation, and other occupations. This free time is hereafter called free period (FP), with one evening equivalent to 1 FP and a full day equivalent to 4 FP, for a total of 10 FP per week.

Per FP spent studying add 3 AS, deduct 1 PS.

Per FP spent on sports and other voluntary approved pastimes (debating societies, choir, etc.), add 1 AS.

Per FP spent on uniform maintenance, tidying rooms, etc., add 1 AS, subtract 1 PS.

Free periods may be assigned to a regular academy duty. See section 6 below for a list of these duties, with privileges and obligations.

Free periods may be spent on prohibited activities within the college; the use of contraband drugs (e.g., tobacco), political activities, practical jokes, etc. Such activities are detected by the academy authorities on a roll of 8 + (DM + 1 per person involved) and punished by a loss of AS, and possibly some PS, depending on the severity and nature of the offense. Cadets can be caught, but still gain PS from the experience if the crime strikes other cadets as especially daring. Sufficiently vile offenses may lead to expulsion from the service. PS points should be awarded for successful illicit actions, again dependent on their nature, but at least two people must be involved for the activity to give a PS reward. These points should be awarded on a sliding scale, with the first person to think of something getting the highest award. Hours stolen from lesson time (see above), may also be used for illicit activities.

Free periods may be spent on activities outside the academy (see below).

Cadet Life: Cadets are expected to be polite to their superiors, including all senior cadets and all officers. This is extended to include cadets of higher PS rating within the same year. In general, anyone with PS exceeding that of a cadet by20 or more must be treated as a superior. Academy servants, NCO's, and non-cadets ignore this system, and are ignored by it.

At the end of each month, cadets take a one day examination, which tests current educational topics. Roll 2136 QM + 1 if EDU 10 +, + 2 if I NT 10 +, + 2 if AS 100 +); on a roll of 9 + the cadet passes and gains + 5 AS, + 1 PS, otherwise the cadet loses 10 AS, 1 PS.

Each year includes six months duty as an officer cadet attached to an arm of the service. In the first year this period is occupied with basic training, as indicated in **Traveller** Books 4 (**Mercenary**) and 5 (**High Guard**). In subsequent years this is a normal service assignment, and may involve some risk. It is convenient if all player characters are assigned to the same duty. If possible, this period should be run as a role-playing scenario, otherwise use normal rolls for survival and decorations. Cadets are not eligible for promotion, except as noted below.

Year's End: At the end of every year, cadets must take a two week series of examinations, testing every aspect of their education. This is passed on a 2D6 roll of 10+, with the modifiers used above for the monthly exams. If the examination is passed, the cadet will gain appropriate skills for the year. Candidates who fail in two successive years are expelled.

Optional: Candidates who pass on adjusted rolls of 16 + are promoted to 01 status and begin a normal service career, leaving the academy immediately.

New Year: At the start of the next academic year, each cadet's AS is returned to its initial level plus 50 points per year served. PS is increased by 10%, reflecting the cadet's new seniority.

See the Events section for details of other important events in the academic year.

CADET ASSIGNMENTS

Each of the academies offer several posts which will occupy some of a cadets' time, but can give privileges and other benefits. Some posts are voluntary, others are assigned by merit.

Class Leader: This post is offered to the cadet (PC or NPQ with the highest AS, and held for the year. If the cadet does not wish to hold the post (roll D6 for 5

+ for NPC's) it will be offered to the next cadet in order of AS rank (time requirement, 4 FP/week). The class leader handles routine administrative work for the senior cadet and the class tutor. The class leader may miss one hour of classes a day without penalty, and gains 10 AS a week. If the class as a whole loses more than 50 AS a week, the class leader will lose 10 AS. If this occurs in four consecutive weeks, the class leader is replaced by the next cadet in line.

Sports Officer: This post is assigned by vote, with any healthy cadet eligible (time requirement, 4 FP/week). This cadet organizes sports and athletic activities for the class, under the orders of the class tutor and other interested parties (usually NCO trainers, groundsmen, etc.). The sports officer gains 5 PS and 5 AS a week, and has access to the keys of sports facilities. D6 NPC's will apply for this post, plus any player characters who wish to apply. NPC voting should be random, but weighted towards the character with the highest PS.

Monitor: Three cadets from each class are offered this post, usually those with the highest AS below the class leader (time

requirement, 2 FP/week). These cadets are deputed to maintain order and report breaches of discipline. Monitors gain 2 AS per breach of discipline reported, but lose D6 PS points (no one likes a squealer). They are also held responsible for persistent breaches of discipline.

Senior Cadet: Cadets in their fourth year may be assigned (randomly) to be senior cadet for classes of the first three years (time requirement, 3 FP/week). The senior cadet is essentially a student advisor, counselor, and watchdog. Senior cadets gain 10 AS per week, and 5 PS.

Referees should feel free to add additional posts relevant to the service or the circumstances of their campaigns.

OUTSIDE THE ACADEMY

Beauville is a remarkably attractive planet, and all three academies are located in pleasant pastoral settings. All have monorail links to the capital, New Versailles, requiring a D6 minute wait plus 10 minutes travel time, cost Cr1 (each way). Members of different academies are most likely to meet in New Versailles, since there are no direct routes between them. New Versailles is divided into several main regions:

Startown: The region south of the spaceport and north of the city center. The

monorail links terminate at a station in this area, and are frequently the scene of muggings, clashes between groups from rival academies, and other incidents. Facilities of the area are typical for a TL 13 city, and include gambling houses, bars, wireheading parlors, and other dens of vice. Many of these establishments are fronts for other types of crime, such as organleggers and drug rings. In general, most areas of Startown are supposed to be off limits to cadets. Activities in this area usually pay a PS reward, but carry a risk of detection and punishment by the academy authorities:

Drinking: Add 1 PS per 10 credits spent, deduct 1 END or 1 DEX (choose randomly) per credit of drink consumed, recovery 1 point/hour. Roll 10+, +1 per point of END or DEX reduced, for drunkenness to be noticed on returning to the academy. Solitary drinking pays no PS reward. Drinking is not punished severely; a drunken cadet loses 5 AS for the first offense of a year, 10 for a second, 15 for the third, etc., and will be refused permission to leave the academy for the next week.

Drugs, Wireheadings, etc.: Treat as drinking, but triple END and DEX effects and costs, halve the recovery rate, and triple the punishments for detected offenses.

Fighting: Most areas of Startown offer some chance of violence, from mugging to riots. The area is patrolled by pairs of policemen with shock clubs, guns, and efficient communications equipment, who will always call for backup before intervening in a fight. Reinforcements generally arrive a minute after a disturbance is reported. Typical mobile police units in this area are G Carriers with riot control weapons and APCs carrying 8 ex-Marine constables with riot control and close quarters combat gear. The academy authorities will notice that a cadet has been fighting on a roll of 8 +, + 1 per point of injury. The severity of academy punishment for fighting is dependent on the nature of the offense. Fighting in self-defense will probably be ignored, but picking fights with civilians

or mugging someone would be severely punished. The PS rewards for fighting also depend on the nature of the action and its result. A cadet who was soundly thrashed by an old lady he tried to mug would probably lose all PS; a cadet who managed to defeat three policemen and get away with their hats would gain considerable PS. All combat should be carried out using normal **Traveller** rules, **Snapshot**, or whatever other combat, system is preferred.

Spaceport: Cadets may visit the port if they are in uniform and carry ID papers to allow passage through the extrality (extraterritoriality) barrier. Cadets have no special status at the port, but can visit public areas like the observation lounge, restaurant, and TAS hostel.

Industrial Zones: Regions occupied almost entirely by automated plants, warehouses, and other facilities. Usually patrolled by police APC's. Cadets will find little excitement here.

City Center: This region contains most of the fashionable cafes, shops, casinos, and bars of the city, and is accessible to cadets. All of the illicit items mentioned above are available, but costs are doubled and a roll of 8 + DM (+ Sreetwise) is needed to find them.

East Plaza Heights: The banking and financial hub of Beauville, a huge arcology devoted mainly to commerce. This edifice is 75 floors high with 175,000 working inhabitants and 3400 permanent residents living in apartments and hotel sections. Facilities include theaters, a stadium, exhibition halls, two museums, and a wide variety of cafes, shops, and recreational zones. All the items mentioned above are available at triple cost, but a roll of 9+ DM (+ Streetwise) is needed to find them.

Memorial Park: A huge landscaped inner city park, the site of the first landing on Beauville, famous for its zoo, flower gardens, and duelling fields (see below). By day, this park is a haven of beauty and peace, at night it is haunted by unsavory types. Night police patrols are frequent, equipped with stun grenades, LI goggles, and carbines.

The Suburbs: A sprawling residential zone (with some shops and entertainment facilities) of little interest to cadets. Roll 11 + (+Streetwise) to find any interesting activities apart from an occasional garden party or church social. Activities in the suburbs are unlikely to alter PS, but cadets who visit the suburbs frequently without a good reason are likely to lose PS; the area is considered extremely unfashionable.

EVENTS, PROGRAMMED AND RANDOM

During the academic period of the year there are various functions, some preplanned and some occurring randomly.

Internal Sports: In month 3, week 2, there is an internal sports contest between the classes of each year. This event gives cadets a chance to earn prestige and status, but can involve some risk. Cadets may enter up to four events. It should be remembered that NPC cadets will also enter events. A few typical events follow, referees may wish to add others more suitable to the service used or the circumstances of their campaign. It should be remembered that some of these events will run in several heats.

Boxing, Wrestling, Alkido, etc.: All these events should be resolved as normal brawling fights, continuing to knockout, with the winner gaining 2 AS and 2 PS.

Freefall Combat: The academies have zero G gymnasia on campus. Unless characters have relevant skills (Vacc, Zero G combat, etc.), they will suffer the usual -4 penalty. Combats are won by the contestant who manages to strike his opponent three times in three rounds, or by a knockout. The winner gains 2 AS, 4 PS, but cadets lose D6 PS for a particularly humiliating defeat.

Marksmanship: Target pistol shooting, 6 shots. Roll 8 + to hit, for each shot score 1 for a hit and 1 for each point over the minimum to hit (to a maximum of 6), -4 for each shot that misses. The winner gains 2 AS, 4 PS.

Blade Combat: Combat using electronically scored weapons with dye markers for visual effects. Run a normal fight, continuing until one of the participants has taken enough "damage" to be rendered unconscious. The winner gains 3 AS, 6 PS, doubled if the loser has not managed to make a hit.

Team Sports: Games equivalent to football, baseball, etc. These should be tailored to the needs of the campaign. Decide AS and PS on the merits and dangers of the game (for example, a rollerball tournament would be more hazardous and rewarding than a Zero G basketball game).

Inter-Academy Sports: Held in month 10, week 4. These events resemble the internal sports, but feature the champions of the academies. It is likely that each will field a few cadets with unusually advanced skills, but players should not be told who they are facing until committed to a particular event.

Inspections: For each week at the academy roll 2D. On a roll of 11 + (no modifiers) there is a snap inspection of bedrooms, studies, etc., at some time during the week. The inspection team will be on the lookout for evidence of drug abuse and other irregularities, non-regulation equipment, untidiness, etc. Each minor infraction costs 1 AS, major offenses are punished more severely.

VIP Visit: Roll 2D6 each month, on 11 + the academy is visited and inspected by an Imperial or foreign notable. Such visits are announced 11136 days in advance, with no cadet allowed to leave the academy on the day before the visit and all cadets detailed to tidying and other preparations. At the referee's discretion such visits may lead to some form of trouble or the acquisition of status.

Leave: In addition to the leave in month 12, cadets are allowed 6 + D6 days leave before and after detached duty. It is assumed that all cadets are able to go home in these periods, but at the referees discretion they may stay at the academy for additional study, or in the city at normal hotel rates.

DUELLING

Duelling is legal on Beauville, but is banned by academy rules. However, this does not stop cadets holding duels off the academy grounds in response to the provocation of others. Cadets fighting duels can improve their PS considerably, but risk severe punishment or even expulsion. Each duel consists of six phases; issuing a challenge, arranging for a second and other preliminary details, choosing weapons, announcing the duel (a necessity under the code duello used on Beauville), fighting it, and the aftermath of the combat. Failure to follow any legal stage may result in a charge of assault or murder.

Challenge: The challenger must approach the other party before at least six witnesses, slap him, and demand satisfaction. Provided there is a legitimate reason for the challenge, the cadet issuing it automatically earns 5 PS. Accepting a challenge earns 3 PS. Cadets who refuse a challenge lose 10 PS unless they are not recovered from a previous duel.

Choice of Weapons: The challenged party has the right to choose weapons, those available being special handguns or blade weapons. The handguns are single shot versions of the conventional snub pistol, with exotic rounds such as tranq or gas banned. More lethal weaponry is not permitted.

Seconds: Each party must choose two seconds, who ensure fair play and punish any breach of the code. NPC's will agree on a 2136 roll of 8 + (DM + 1 per 50 PS of the party asking for seconds).

Announcement: Beauville's law requires the parties to a duel to register at the public notary's office in East Plaza Heights. There is a registration fee of Cr100, covering paperwork, maintenance of the grounds, and the provision of a referee and medical aid. Duels must be registered at least a week before they are fought. On registration, an announcement is posted at the duelling grounds in Memorial Park, listing the names of the duellists, the weapons to be used, and the date and time of the duel. For an additional fee of Cr50, the announcement will list false names, but the true names must be given to the notary. Duels can be fought on any day between 0700 hours and 2100 hours.

The Duel: Both parties to a duel must travel to the duelling grounds with their seconds, and arrive at the posted time. The contest proceeds in the following stages:

The referee calls for the duellists (by real or assumed names). If either party fails to appear, after five minutes the other party is automatically victor and gains 10 PS, the missing party loses 20 PS.

The duellists remove all armor (fencing masks are allowed), and are searched for concealed weapons.

Both parties are given a quick medical check to ensure that they are not drugged, hypnotized, or ill. If either party fails the check, the duel is declared illegal, and the parties must either agree to abandon it (at a cost of 5 PS each), or arrange another duel (for the full fee).

The referee questions both parties to ensure that they still wish to fight. Parties wishing to withdraw at this or any other stage lose 20 PS.

The referee carries a matched pair of weapons of the type declared in the announcement. At both parties request, other weapons may be substituted, but this is unusual. The duellists toss a coin to see who gets first choice, then choose weapons.

The duellists proceed to the duelling area, carrying their own weapons. Firearm duels are fought in a court with armored glass walls (5 meters high x 10 meters wide x 30 meters long); other duels take place in the open.

The duelists stand at opposite ends of the duelling area, and wait for the referee to signal. They may not fire or approach each other until the signal is given.

The referee drops a handkerchief. As it touches the ground, the duel may begin.

The duel should be fought using whichever combat system is preferred by the referee; Book 1, **Azhanti High Lightning**, **Snapshot**, or **Striker**. It continues until either character surrenders (for a loss of 10 PS) or collapses. If the victor attempts to continue past this point the duel becomes assault or murder, and the seconds are honor bound to interfere.

The victor gains 20 PS, plus or minus 5 PS for each level of relevant combat skill. For example, a cadet with Foil 1 defeating a cadet with Foil 0 loses 5 PS, but a cadet with Foil 1 defeating one with Foil 2 gains an extra 5 PS. The loser forfeits the same number of points. If either duellist performs some extraordinary feat of skill or courage (for example, refusing to fire at the opponent, then walking up to him and knocking him unconscious) there should be an appropriate PS reward. Seconds gain 5 PS each.

Aftermath: Injured duellists receive medical treatment, which will restore 2D6 2 points of damage, and requires one hour. Additional treatment takes an hour per D6 1 points of damage recovered, and costs Cr100/hour.

If either party is killed the matter must be reported to the academy immediately. If this is done the survivor will be expelled, otherwise the survivor will be arrested, taken off planet, and court-martialed. The code used makes death unlikely.

When both parties are sufficiently recovered they can return to the academy. The roll to enter the academy without wounds being detected is the same as that needed to enter after a fight (see above), but is modified by circumstances (for example, if either party wears a bloodstained uniform).

Cadets caught duelling are liable to be expelled, but on a roll of 7+ (+1 per 5 points SOC, +1 per 50 points AS) this will be commuted to loss of privileges (permission to leave the academy grounds, and any posts of responsibility held) and the loss of 50 + (2D6x10) points AS. If one cadet is allowed to stay, both will be allowed to stay. Cadets seconding a duel are liable to loss of privileges and AS, to a lesser extent.

REFEREES' NOTES

The system used in this article is complex and requires some effort by the referee, since it involves 40 or more NPC's who must be followed through the academy year. Fortunately only a few will interact with the players in any given week. Many details can easily be handled by a computer program, and this may be advisable to speed play. It should be noted that this article has only dealt with a few details of academy life, and the referee should feel free to improvise other events and situations (from the literature referred to at the start of this article, or from other sources). For example, players or NPC cadets may wish to cause trouble for other cadets by informing the authorities of impending duels, rule infractions, and the like, and may attempt to lower their rival's PS by spreading rumors or gossip. Players may wish to form long term relationships, marry (against academy rules), or engage in intrigue and espionage. it should be remembered at all times that NPC's are involved in similar activities to players, and may spoil their plans.

Weekly Cycle: This game proceeds on a weekly cycle, and players should be asked to give a rough outline of their intentions at the start of the week. The referee should discover how players intend to use free periods, and request

details of any activities which may affect other players or NPC's. It may be advisable to take such information in writing without letting players see each others' notes.

NPC Activities: For each week of the campaign make the following die rolls for each NPC who is not indicated in the player's notes:

AS is modified by 2x 2D-7) points. For example, a roll of 4 indicates $2 \times (4 7)$ points, or 6 points. The NPC loses 6 AS points.

PS is modified by $2 \times (2D - 7)$ points. For example, a roll of 9 indicates $2 \times (9 - 7)$ points, or 4 points. The NPC gains 4 PS points.

Roll 2D6 for unusual events. On a roll of 3 11 nothing happens, on 2 the NPC is involved in an activity which does not affect the player-character, on 12 the activity affects the characters.

If an unusual event is rolled, roll 2D6 and consult the following table. The effect on player characters is shown in brackets, and should be ignored if the previous die roll was 2.

UNUSUAL EVENTS

Die	Event
23	Duel (Challenge to PC),
4	Dinner Party Q6 PC's invited)
56	Practical joke (on PC)
7	Returns to academy drunk (with PCs)
89	Insult another cadet (PC)
10	Cheating scandal (PC also accused.)
11	
12	Duel (PC asked to second)

Affected player-characters may be selected randomly or by reference to their previous contact with the NPC. If this system is used the referee needs to keep a log of each NPC's action. If player-characters are not involved in these activities the referee should work out which other cadets are involved. Referees may wish to play out the results of these events, by letting the players witness challenges and the result of NPC actions, or simply work out the new PS and AS levels and the resultant pecking order within the class.

At appropriate periods NPC's will be involved in examinations and sporting activities. The referee should roll the results of these activities randomly.

Once all NPC cadets' actions have been calculated, the total AS of the class should be compared with that of the previous week. Divide the difference by the number of cadets multiplied by 10. The resultant number is a modifier on the actions of staff and other NPC's, and is used as a DM when determining matters of expulsion, punishment, or reward. For example, if a class of 40 lose 50 AS in a week the DM is 50/40, or 1.25, which is rounded to 1.

The referee should determine the results of periods of detached duty for NPC's as well as player cadets.

If the referee wishes to reduce the size of classes it is easy to arrange a mass expulsion (a cheating scandal is good), a monorail crash, or some other convenient event. It is inadvisable to reduce class size below 15 NPC cadets plus the PC's in the first year, 12 plus players in the second, 10 plus players in years 3 and 4.

Ending the Game: If the game proceeds well it should be continued through the full term. At the end of the term all cadets either pass their examinations, and become officers (rank 01), or fail and revert to enlisted status for the subsequent term. In either event, the rest of the character's career may be determined by the normal routines in Books 4 5.

Cadets (both players and NPC's) are free to leave the academy at any time and revert to non-commissioned status, to serve out the balance of a short term.

At time of war, and in response to other emergencies, cadets may be commissioned as officers (rank 01) and assigned to fulltime service duties in an appropriate service branch. This is a convenient way of ending the game if time is short, with the balance of a character's service worked out by the normal game rules.

Marcus L. Rowland

The Tuktaar Connection

The adventurers, a group of K'kree in a mercantile party, have come to Tuktaar (K'righeek 0710 C655AR(5) F), a world near the edge of the Two Thousand Worlds near the Hiver K'kree frontier. The party is engaged in

ordinary trade and commerce, but soon after their cargo has been unloaded, receives an order to meet with the noble administrator responsible for regulation of commercial operations on the world. Accompanied by suitable retinues, the patriarchs of the families involved in the merchant group call on the noble.

This noble, Ghek'kurik, commences the meeting with brisk efficiency. In the past K'kaatu (about 70 standard days), several K'kree merchant vessels have been attacked, disabled, and boarded, their cargo holds ransacked and their

entire crew and crew family contingent killed. It is believed that human raiders are responsible for the incidents, but the

well- timed and carefully executed have these attacks been.

Humans are suspected for two reasons. First, one or two fragmentary transmissions from ships in distress have indicated that the vessels in question are very small (by K'kree standards), and of a basically human configuration. Secondly, the motive for the attacks seems to be an intent to hijack a particular type of cargo !xug'k, which humans know as highleaf.

Highleaf is a mildly narcotic agricultural product popular to the luxury trade in K'kree space, about as stimulating to the K'kree system as a glass of wine is to humans. But this mild narcotic has a much stronger effect on humans who chew it, for it is one of the most potent drugs known to man, worth perhaps

> Cr25 per kg in the Two Thousand Worlds; it is worth up to Cr25.000 for the same size lots to human buyers in the Imperium and various nearby client states. It is extremely addictive and can be guite dangerous to humans if used too often or if improperly processed.

Each ship which was attacked carried a fairly large cargo of !xug'k, which was missing when. The damaged vessels were checked out by naval patrols. The matter is a grave cause for concern; usually, human traders acquire such cargos in perfect legality (and what they do with them in human space, where highleaf is illegal, is their own business). Now, it seems that some

unscrupulous human group has decided to prey on K'kree shipping. The of crewmen, massacre servants, even females and children, is enough to move any K'kree to rage.

So far, Ghek'kurik tells them the navy has been unable to stop the raids. The

attackers are too well organized, too capable staging of their ambushes quickly and competently to give the patrols a chance to close in. Ghek'kurik has decided that the obvious alternative is to set a trap. If the proper bait (an unusually large cargo of !xug'k) is available aboard an innocent merchant ship, perhaps the humans will pounce again. But, if the crew of the ship is ready, they are unlikely

AMDERZONE

to be so successful. Ghek'kurik wants the group to carry out this special mission.

As is the case under most normal circumstances in the Two Thousand Worlds, the orders of an individual of higher caste must be obeyed. Nonetheless, the noble administrator does not wish to force the group to undertake such a hazardous job. He gives them the option of backing out,

though he adds that they, being the only ship currently in port, are his best chance of catching these criminals before they can strike at another innocent party.

If the group accepts, Ghek'kurik will add some additional details. Every ship that has been ambushed has been taken in the Tuktaar system; each one has also been either coming from or bound to the Lalendriss system, which is the home of a subject race in the adjacent subsector, a jump 2 away from Tuktaar.

There is a distinct possibility that dissident elements on Lalendris (there are strong anti-K'kree movements there) are supplying information to the raiders. There are formalities to be gone though at either end of the route to import, export, or just tranship cargo through a subject starport, and it could be that word of ships carrying highleaf is passed on to the raiders. As to the raiders themselves, it can only be assumed that they are a single ship, perhaps operating from the Tuktaar planetoid belt. There have been a couple of noticeable gaps in the patterns of the raids, presumably when the ship was away to sell its ill-gotten cargo or to be serviced. Human traders have visited Lalendriss and Xikanookr several times of late, so either world (or both worlds) could have been giving support to the pirates without even realizing it.

Locating and destroying these raiders is a matter of paramount importance.

Referee's Information:

The actual situation is considerably more dangerous than any of the K'kree realize. It goes far beyond a piracy/smuggling ring.

In actual fact, the raiders are not humans at all. They are dissidents from Lalendriss who have obtained small, human built starships. A group of humans is involved, but behind the scenes they are arms merchants who are selling various weapons to the dissidents in exchange for highleaf. The dissidents are equipping themselves for an uprising against K'kree domination, which they hope will have the protection of the neighboring Hive Federation.

The humans are, in fact, based on a world of a Federation not far from Tuktaar, where they meet the raiders every so often to exchange weapons for highleaf out of reach of the K'kree navy. The Hivers are unaware of the situation, and would not condone it if they found out, but humans are common enough in the Federation and are pretty much free to come and go as they please.

The actual course of the adventure will be largely up to the referee. If the merchant K'kree go through the proper steps, notifying the Lalendriss representatives on Tuktaar to obtain cargo clearances prior to departure, they will be hit on their way to jump point. Resolve the attack by assuming 10 of the humanoid Lalendrians board the K'kree ship, in complete combat armor and armed with laser rifles. The combat which follows should go in favor of the K'kree if they are prepared for the action.

Once the boarders are defeated, there remains the ship. To take it, K'kree troops must overcome any enclosure problems (use the Reaction rules) and launch a boarding attack of their own; five more opponents, similarly armed, await them there.

Defeat of the initial Lalendrian attack will prove who was responsible for the raid, but it will take capture of the raiding ship and its captain to uncover details of the plot. It is fully possible that the referee may wish to follow up with additional adventures involving the smashing of the conspiracy and/or attempts to root out the humans who are behind the endeavor. Such further activities may be staged entirely at the referee's discretion.

John Marshall

Emil "Boomer" Brankovich

Ex Army Corporal C9D674, Age: 30, 3 terms, Cr 10,000.

Army, three terms. Enlisted in Infantry, transferred to Commandos after first term. **Special Assignments:** Commando School.

Awards and Decorations: Seven Combat Service ribbons, three MCUF, two MCGs, one purple heart.

Equipment Qualified On: ACR, Demolition, LAG.

Morale: 20

Skills: Brawling 3, Demolition 2, Combat Rifleman 2, LAG 2, Recon 1, Survival 1 **Possessions**: LAG, ACR "Boomer" Brankovich is a big man; his nickname is variously said to have come from his love of explosives, his awesome right cross, or his stentorian voice. Any one of these reasons is apt enough.

At 30 years of age, Boomer is old for a corporal. Actually, he has been promoted to sergeant's rank four times, only to be busted again each time for offenses ranging from disobedience to a direct order to striking a superior officer. Though he is an exceedingly capable soldier, Brankovich has been a definite discipline problem, and this has hampered his progress in the military.

Brankovich mustered out of the service in company with an old comrade in arms, Sergeant Thomas Cordoba usually known as "Sarge" among his friends. Boomer and Sarge have since become drifters, taking up odd jobs as mercenaries, bodyguards, or hired guns for a variety of employers. They are inseparable companions about whom it has been said (but out of Boomer's hearing) that "Sarge is the brains, and Boomer's the muscle."

Actually, Boomer is by no means stupid. He is, however, shorttempered and prone to blind, uncontrollable rages, particularly when injured, or when Sarge is endangered in some way. Given his immense strength, Boomer can be a serious problem under such circumstances, to friend and those who happen to be with him in danger when in the face of the enemy, and even friends have been known to feel his wrath if they happen to be in his way during an outburst.

Boomer doesn't respond well to authority. He respects expertise and ability, and will obey orders from those he believes are competent to give them (such as Sarge). Suicidal orders tend to trigger his temper hence some of his more spectacular service outbursts. An individual who can earn his respect will find that Boomer is a loyal and devoted friend for life.

Though highly competent with an ACR, Boomer's favorite weapon is, beyond a doubt, his LAG. One superior once commented that Boomer fired an LAG one-handed, like a pistol. He added that he wouldn't have been surprised to see the big man carrying an 8 inch howitzer instead of a rifle. Despite the hyperbole, it's true that Boomer prefers the LAG to other weapons, and has a habit of carving notches in the stock to record enemies dispatched by the weapon.

In an adventure, Boomer and Sarge make excellent hirelings, the sort of people who are perfect for a bit of fire support on a rough mission. They would be especially apt in adventures with a true military setting, but come in handy in almost any situation where firepower counts.

Though useful, these hirelings carry with them the seeds for all sorts of interesting complications in what might otherwise be a perfectly straightforward scenario. Brankovich's temper can get the playercharacters into a great deal of trouble. Most particularly, Boomer could be a serious problem if something happened to Sarge. If Sarge should be badly injured or captured, Boomer will perform acts of incredible endurance, strength, or valor to get him out of danger, regardless of the cost. He will also take a very dim view of anyone who considers Sarge expendable or who tries to separate the two of them (with a correspondingly favorable reaction to those who support him in his determination to help his friend).

Should Sarge be killed, Boomer's normally unstable personality will become wildly unpredictable. Characters who talk about Sarge, or otherwise remind Boomer of his loss, could easily wind up as notches on the LAG gunstock or a mass of bruised flesh from Brankovich's powerful fists. The corporal's ultimate fate will probably be a tragic one following the loss of Sarge, since he will take increasingly greater risks thereafter.

Boomer isn't only good as an NPC hireling. He is originally derived from a playercharacter that made such an impression that he soon entered playtest group folklore, reappearing as an NPC from time-to-time years after being retired by the original player. As a player-character, Boomer can be a lot of fun. Players are encouraged to get into the role properly. The original version of Boomer was played largely through the use of a Reaction Table, which regulated his tendency to explode under proper provocation. Such a table can be easily constructed by interested players or referees, with a die roll being made every time the situation seems to warrant a possible adverse reaction by the big corporal. Done with consistency and style, this can encourage true role-playing in a game where players all too often tend to play idealized images of themselves.

Boomer and Sarge are, of course, a matched set, and stats for the Sergeant are provided below.

Thomas "Sarge" Cordoba

Ex Army Gunnery Sergeant, 7A9A85, Age 34, 4 terms Cr6000

Army, four terms. Enlisted in Cavalry, transferred to Commandos after second term.

Special Assignments: Commando School, Protected Forces Training.

Awards and Decorations: Six combat service ribbons, two MCUF, one MCG, three purple hearts.

Equipment Qualified On: ACR, Grav Vehicle, Vacc Suit, VRF Gauss Gun. Morale: 18

Skills: Combat Rifleman 2, Grav Vehicle 3, Instruction 1, Leader1, Recon 1, Survival 1, Vacc Suit 1, VRF Gauss Gun 2.

Possessions: ACR

J. Andrew Keith
